

Feel free to use this as a template for your documentation in this class. You can add rows to the table as needed, or remove extra rows if you would like.

You can also just follow the standard documentation style that I demonstrate in class.

Function Name	Inputs & Output	What does it do?
backgroundColor	User selects color and the background changes to that color.	The function uses a colorPicker for the user to select any color they want. Then the background of the web page changes to the selected color.
font-button	User presses button and the font changes	When the user clicks the button, the web page changes to the assigned font.
change-topic	Outputs text box	Makes the text box visible when the "other" radio button is selected.
Elem (for js-topic-other)	Makes text box disappear	Makes the text box go away when the "other" radio button is deselected.
Event (for js-form)	Submits new data	Submits the new data and displays a success or error message.
sendData	Submits data	Sends all the data from the js-form to a new php file and displays a success or error message.

If you have a complicated line or section of code, talk about it here.

The Code	What does it do?

If you have any errors, talk about it here. If there is no Error Message, leave that column blank.

Error Message	Put the error in your words	What did you try to fix it?

If you used anything we didn't cover in class, use this table.

Name	Link to Docs	What does it do?	Why did you use it?
